Historical Note

What is Symmetry?

Symmetry

- ▶ Defined as “patterned self-similarity”.
- ▶ Generated by a transformation \mathcal{S} of an object O_1 into O_2 .
- ▶ $\mathcal{S}(O_1)$ is not distinguishable from O_2 .
- ▶ Common \mathcal{S} are translation, rotation and reflection.

Crafting a Paper Snowflake

How to cut out a snowflake from a piece of paper?

Crafting a Paper Snowflake

How to cut out a snowflake from a piece of paper?

Crafting a Paper Snowflake

How to cut out a snowflake from a piece of paper?

In general biological science problems have many geometric symmetries.

Why is Symmetry?

- ▶ $CSP = (V, D, C) \in NPC$, but \exists islands of tractability.
- ▶ Using the structure of CSP to reduce complexity, or to reduce the problem size.
- ▶ Symmetry can occur in V , D and C ex. ALL-DIFF constraint.
- ▶ CSP's elements that are symmetric under \mathcal{S} create an equivalence class.
- ▶ Property detected in one element of an equivalent class can be generalized to all elements of that class. Ex.
 $D = \{1, 2, 3, 4, 5, 6, 7\} \Rightarrow D = \{[2, 4, 6], [3, 5, 7]\}.$

5-queens Symmetry Example $\mathcal{S} = 180$ Rotation

x_1	1	2	3	4	5
x_2	1	2	3	4	5
x_3	1	2	3	4	5
x_4	1	2	3	4	5
x_5	1	2	3	4	5

5-queens Symmetry Example $\mathcal{S} = 180$ Rotation

x_1	1	2	3	4	5
x_2	1	2	3	4	5
x_3	1	2	3	4	5
x_4	1	2	3	4	5
x_5	1	2	3	4	5

- ▶ Rotate by 180 degrees.

5-queens Symmetry Example $\mathcal{S} = 180$ Rotation

x_1	1	2	3	4	5
x_2	1	2	3	4	5
x_3	1	2	3	4	5
x_4	1	2	3	4	5
x_5	1	2	3	4	5

x_5	5	4	3	2	1
x_4	5	4	3	2	1
x_3	5	4	3	2	1
x_2	5	4	3	2	1
x_1	5	4	3	2	1

- ▶ Rotate by 180 degrees.

5-queens Symmetry Example $\mathcal{S} = 180$ Rotation

- ▶ Rotate by 180 degrees.
- ▶ x_1 exchanges with x_5 and x_2 with x_4 .
- ▶ New domains $\theta(val) = 6 - val$ for each x_i .
- ▶ Equivalence classes:
 - ▶ Variables $\{x_1, x_2\}$, $\{x_2, x_4\}$ and $\{x_3\}$.
 - ▶ Values $\{1, 5\}$, $\{2, 4\}$, $\{3\}$.

5-queens Symmetry Example $\mathcal{S} = 180$ Rotation

- ▶ Rotate by 180 degrees.
- ▶ x_1 exchanges with x_5 and x_2 with x_4 .
- ▶ New domains $\theta(val) = 6 - val$ for each x_i .
- ▶ Equivalence classes:
 - ▶ Variables $\{x_1, x_2\}$, $\{x_2, x_4\}$ and $\{x_3\}$.
 - ▶ Values $\{1, 5\}$, $\{2, 4\}$, $\{3\}$.
- ▶ Reflection about the horizontal axis and vertical axis.

5-queens Symmetry Example $\mathcal{S} = 180$ Rotation

- ▶ Rotate by 180 degrees.
- ▶ x_1 exchanges with x_5 and x_2 with x_4 .
- ▶ New domains $\theta(val) = 6 - val$ for each x_i .
- ▶ Equivalence classes:
 - ▶ Variables $\{x_1, x_2\}$, $\{x_2, x_4\}$ and $\{x_3\}$.
 - ▶ Values $\{1, 5\}$, $\{2, 4\}$, $\{3\}$.
- ▶ Reflection about the horizontal axis and vertical axis.
- ▶ Rotation by 360? Rotation by 90?

5-queens - Different Formulation

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

- ▶ $X = \{x_1, x_2, x_3, x_4, x_5\}$
- ▶ $D = \{1, 2, \dots, 25\}$
- ▶ What are the symmetries here? Do they include domains, variables or both?

5-queens - Different Formulation

1	2	3	4	5	1	2	11	16	21
6	7	8	9	10	6	7	12	17	22
11	12	13	14	15	3	8	13	18	23
16	17	18	19	20	4	9	14	19	24
21	22	23	24	25	5	10	15	20	25

- ▶ $X = \{x_1, x_2, x_3, x_4, x_5\}$
- ▶ $D = \{1, 2, \dots, 25\}$
- ▶ What are the symmetries here? Do they include domains, variables or both?

5-queens - Different Formulation

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

- ▶ $X = \{x_1, x_2, x_3, x_4, x_5\}$
- ▶ $D = \{1, 2, \dots, 25\}$
- ▶ What are the symmetries here? Do they include domains, variables or both?

5-queens - Different Formulation

- ▶ $X = \{x_1, x_2, x_3, x_4, x_5\}$
- ▶ $D = \{1, 2, \dots, 25\}$
- ▶ What are the symmetries here? Do they include domains, variables or both?

5-queens - Different Formulation

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

- ▶ $X = \{x_1, x_2, x_3, x_4, x_5\}$
- ▶ $D = \{1, 2, \dots, 25\}$
- ▶ What are the symmetries here? Do they include domains, variables or both?

5-queens - Different Formulation

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

- ▶ $X = \{x_1, x_2, x_3, x_4, x_5\}$
- ▶ $D = \{1, 2, \dots, 25\}$
- ▶ What are the symmetries here? Do they include domains, variables or both?
- ▶ All 8 symmetries.

Formulation of CSP has Symmetry and not the Problem

- ▶ The definition of the symmetry applies to the definition of CSP and not to the problem itself.
- ▶ Different CSP's formulations of the same problem can have different symmetries.
- ▶ What symmetry to select?

Formulation of CSP has Symmetry and not the Problem

- ▶ The definition of the symmetry applies to the definition of CSP and not to the problem itself.
- ▶ Different CSP's formulations of the same problem can have different symmetries.
- ▶ What symmetry to select? **What about one that produces the smallest number of equivalent classes?**

Why Symmetry?

Symmetry Examples

Approaches for Symmetrical CSPs

Adding symmetry-breaking global constraints

Search space modification

Heuristics modification

Historical Note

Three Approaches for Symmetrical CSPs

Adding symmetry breaking global constraints

- ▶ Adding global constraints to convert it to an asymmetrical CSP.

Modify search

- ▶ Pruning symmetric states as they appear in search.

Modify search heuristics

- ▶ Using symmetry-breaking rules to guide search.

Removing Symmetry from the Problem - Global Symmetry

- ▶ Puget [93] while developing PECOS tool.
- ▶ Symmetry can cause a combinatorial explosion of the search space.
- ▶ Arc-consistency AC is not adapted to symmetrical CSPs. Ex. *Pigeon Hole* problem.
- ▶ In symmetrical CSP a *permutation of the variables* map one solution onto another solution.
- ▶ Removing symmetrical solutions by adding a constraint - if $C \subset C'$ then $Sol(P') \subset Sol(P)$ - reduction.
- ▶ Add static symmetry breaking constraints - *an ordering constraint* $x_1 < x_2 < \dots < x_n$ - and do AC after that.

Creating a Global Constraint

Example

- ▶ $V = \{v_0, v_1, v_2\}$, $D = \{0, 1, 2\}$
- ▶ $C : v_0 \neq v_1 \wedge v_1 \neq v_2 \wedge v_2 \neq v_0$
- ▶ How many solutions?

Creating a Global Constraint

Example

- ▶ $V = \{v_0, v_1, v_2\}$, $D = \{0, 1, 2\}$
- ▶ $C : v_0 \neq v_1 \wedge v_1 \neq v_2 \wedge v_2 \neq v_0$
- ▶ How many solutions?
- ▶ Has a symmetry (permutation): $v_0 \rightarrow v_1, v_1 \rightarrow v_2, v_2 \rightarrow v_0$

Creating a Global Constraint

Example

- ▶ $V = \{v_0, v_1, v_2\}$, $D = \{0, 1, 2\}$
- ▶ $C : v_0 \neq v_1 \wedge v_1 \neq v_2 \wedge v_2 \neq v_0$
- ▶ How many solutions?
- ▶ Has a symmetry (permutation): $v_0 \rightarrow v_1, v_1 \rightarrow v_2, v_2 \rightarrow v_0$
- ▶ Adding $v_0 < v_1 < v_2$ - How many solutions?

General Direction

- ▶ Enforcing *GAC* on this global constraint reduces the problem.
- ▶ Depending on the decomposition of a problem *GAC* propagation can be *NPC*.
- ▶ In "other" constraint paper by Law et al. [CP07].
 - ▶ Proposed *SIGLEX* global constraint.
 - ▶ Its *GAC* propagation is *P*.
 - ▶ But it prunes only some symmetric values in general cases.

Symmetry is Dynamic [Meseguer & Torras 2001]

x_1	-		-		-
x_2		-	-	-	
x_3	-	-	q	-	-
x_4		-	-	-	
x_5	-		-		-

- ▶ Symmetries holding at the initial states is a global symmetry.

Symmetry is Dynamic [Meseguer & Torras 2001]

x_4	-			-	
x_5	-				-

180

- ▶ Symmetries holding at the initial states is a global symmetry.
- ▶ After an assignment to v_i the global symmetry may break.
- ▶ Yet, new symmetries can appear in some states.

Symmetry is Dynamic

x_1	-	q	-	-	-
x_2	-	-	-		
x_3		-		-	
x_4		-			-
x_5		-			

- ▶ Symmetries holding at the initial states is a global symmetry.
- ▶ After an v_i assignment the global symmetry can break.
- ▶ Yet, new symmetries can appear in some states.
- ▶ Symmetries can be broken and restored during the search.

Symmetry is Dynamic

x_1	-	q	-	-	-
x_2	-	-	-		
x_3		-		-	
x_4		-			-
x_5		-			

x_1	-	q	-	-	-
x_2	-	-	-	-	
x_3		-		-	
x_4		-	-	-	-
x_5	-	-	-	q	-

- ▶ Symmetries holding at the initial states is a global symmetry.
- ▶ After an v_i assignment the global symmetry can break.
- ▶ Yet, new symmetries can appear in some states.
- ▶ Symmetries can be broken and restored during the search.

Pruning Symmetric States from Search

Symmetric Variables [Brown et al. 1989]

- ▶ Does not select vvp if vvp leads to a redundant partial assignment.
- ▶ Determines if a current partial assignment X is equivalent to a smaller assignment under a symmetry group G .
- ▶ Has pseudo code of the Backtracking Algorithm with Symmetries.
- ▶ Symmetries are given.

Pruning Symmetric States from Search

Symmetric Values [Freuder 1991]

- ▶ Only selects one *val* from equivalence class of values during *vvp* selection.
- ▶ Values *a* and *b* are neighborhood interchangeable if each *vvp* is consistent with their neighborhood.
- ▶ Algorithm to determine local value interchangeability is $O(n^2d^2)$.
- ▶ Symmetries are discovered.

Symmetric Variables and Values [Backofen & Will CP99, Gent & Smith 2000]

- ▶ Does not interfere with the heuristic searches (variable ordering).
- ▶ Adds symmetry breaking constraints to the right branches of search tree.

x_1	q				
x_2			q		
x_3					
x_4					
x_5					

$x_1 = 2, x_2 = 3$ - backtracking

Symmetric Variables and Values [Backofen & Will CP99, Gent & Smith 2000]

- ▶ Does not interfere with the heuristic searches (variable ordering).
- ▶ Adds symmetry breaking constraints to the right branches of search tree.

x_1	q				
x_2			X		
x_3					
x_4			?		
x_5					

$x_1 = 2, x_2 = 3$ - backtracking

$x_1 = 2, x_2 \neq 3$ - should we consider $x_4 = 3$?

Symmetric Variables and Values [Backofen & Will CP99, Gent & Smith 2000]

- ▶ Does not interfere with the heuristic searches (variable ordering).
- ▶ Adds symmetry breaking constraints to the right branches of search tree.

x_1	q				
x_2		X			
x_3					
x_4		?			
x_5					

$x_1 = 2, x_2 = 3$ - backtracking

$x_1 = 2, x_2 \neq 3$ - should we consider $x_4 = 3$? Depends if $x_5 = 5$ or not

If $x_5 \neq 5$ then $x_2 = 3$ and $x_3 = 3$ are not equivalent. Generally it is not known if $x_5 = 5$ or $x_5 \neq 5$.

Adding a conditional constraint $x_1 = 1 \wedge x_2 \neq 3 \wedge x_5 = 5 \Rightarrow x_4 \neq 3$.

Use Symmetry to Guide Search

Dynamic Variable Ordering [Meseguer & Torras 2001]

- ▶ Direct search toward subspaces with many non-symmetric states.
- ▶ Selecting vp that breaks the most of the symmetries.
- ▶ It will lead to more evenly distributed solutions in the CSP's state space.
- ▶ More about it in my project presentation.
