Features of Lisp

1. Interactive: interpreted and compiled
2. Symbolic
3. Functional
4. Second oldest language but still ‘widely’ used
   (Emacs, AutoCad, MacSyma, Yahoo Store, Orbitz, etc.)

Software/Hardware

- We have Allegro Common Lisp (by Franc Inc.): alisp and mlisp
- There are many old and new dialects (CormanLisp, Kyoto CL, LeLisp, CMU CL, SBCL, ECL, OpenMCL, CLISP, etc.)
- There have also been Lisp machines (Symbolics, Connection Machine, IT Explorer, others?)
Lisp as a functional language

(function-name arg1 arg2 etc)

1. Evaluate arguments
2. evaluate function with arguments
3. return the result

Functions as arguments to other functions:
(name2 (name1 arg1 arg2 etc) arg3 arg2 etc)
Symbols

A symbol is a data structure with:
- a name
- a value
- a function
- a package, and
- a property list (plist)

(setf mysymbol 'hello-world) HELLO-WORLD
(defun mysymbol (x) (* x x)) MYSYMBOL
(symbol-name 'mysymbol) "MYSYMBOL"
(symbol-value 'mysymbol) HELLO-WORLD
(symbol-function 'mysymbol) #<Interpreted Function MYSYMBOL>
(symbol-package 'mysymbol) #<The COMMON-LISP-USER package>
(funcall (symbol-function 'mysymbol) 5) 25
(find-symbol "HELLO-WORLD") HELLO-WORLD
(find-symbol "HELLO-WORLD") :INTERNAL
Symbolic language

- Atoms: numeric atoms (numbers), symbolic atoms (symbols)

- Lists:

Symbolic expressions: symbols and lists
More constructs

- Data types:
  atoms and lists, packages, strings, structures, vectors,
  bit-vectors, arrays, streams, hash-tables, classes (CLOS), etc.
  NIL, T, numbers, strings: special symbols, evaluate to self

- Basic functions:
  first (car), rest (cdr), second, tenth
  setf: does not evaluate first argument
  cons, append, equal, operations on sets, etc.

- Basic macros:
  defun, defmacro, defstruct, defclass, defmethod,
  defvar, defparameter
Special forms: `let`, `let*`, `flet`, `labels`, `progn`,

```lisp
(defun mytest (item)
  (let* ((item '(1 2 3 4))
         (item2 (append item item)))
    (format t "~%Item is ~a" item)
    (format t "~%Item2 is ~a" item2))
  (format t "~%Item is ~a" item))

(mytest 'mysymbol)
```

Item is (1 2 3 4)
Item2 is (1 2 3 4 1 2 3 4)
Item is MYSYMBOL
NIL
- Predicates:
  listp, endp, atom, numberp, symbolp, evenp, oddp, etc.
- Conditionals:
  if <test> <then form> <else form>,
  when <test> <then form>,
  unless <test> <else form>,
  cond,
  case

(if (oddp 3) (* 3 2) 3)
6

(cond ((listp mysymbol) (format t "It is a list"))
  ((numberp mysymbol) (format t "It is a number"))
  ((atom mysymbol) (format t "It is an atom"))
  (t (format "It is something else")))

It is an atom
NIL
Looping constructs: dolist, dotimes, do, mapcar, loop

(let ((list '(1 2 3 4 5))
      (result nil))
  (dolist (item list (reverse result))
    (push (* item item) result)))

(let ((list '(1 2 3 4 5))
      (result nil))
  (do ((mylist list (rest mylist)))
      ((endp mylist) (reverse result))
    (push (* (first mylist) (first mylist)) result)))

(mapcar #'(lambda(x) (* x x)) '(1 2 3 4 5))

Lambda functions!!
My favorite functions

- mapcar: unary function and alist, generates a new list obtained by applying the function to each element in the list
- reduce: binary function and alist, applies the function to the first two elements of the list, then to the result and the third element, then to the result and the fourth element, etc.

(mapcar #'(lambda(x) (* x x)) '(1 2 3 4 5))

(reduce #'(lambda(x y) (if (> x y) x y)) '(1 5 2 6 3 7 4))
A really functional language

(defun <function-name> <arg1> <arg2> <arg3> ...
(flet ((local-function-name <arg a> <arg b> ....
........
<return some value>))
)
)

(#'(lambda (x) ........) ..)

<some-value>)

Regular function

Anonymous function

Local function

defun, flet/labels, lambda
What makes Lisp different?

Paradigms of AI Programming, Norvig

- Built-in support for lists
- Dynamic storage management (garbage collection!)
- Dynamic typing
- First-class functions (dynamically created, anonymous)
- Uniform syntax
- Interactive environment
- Extensibility
Allegro Common Lisp

• Free download: www.franz.com/downloads/

• Available on Linux (cse.unl.edu).

• Great integration with emacs
  Check www.franz.com/emacs/ Check commands distributed by instructor

• Great development environment
  Composer: debugger, inspector, time/space profiler, etc.
  (require 'composer)
(in-package "USER")
