A little bit of Lisp

Introduction to Artificial Intelligence
CSCE 476-876, Spring 2005
www.cse.unl.edu/~choueiry/S05-476-876

Read LWH: Chapters 1, 2, 3, and 4.
Every Wednesday: ask your questions on Lisp/xemacs.

Berthe Y. Choueiry (Shu-we-ri)
choueiry@cse.unl.edu, (402)472-5444

Features of Lisp

1. Interactive: interpreted and compiled
2. Symbolic
3. Functional
4. Second oldest language but still ‘widely’ used
   (Emacs, AutoCad, MacSyma, Yahoo Store, Orbitz, etc.)

Software/Hardware

- We have Allegro Common Lisp (by Franc Inc.): alisp and mlisp
- There are many old and new dialects (CormanLisp, Kyoto CL, LeLisp, CMU CL, SBCL, ECL, OpenMCL, CLISP, etc.)
- There have also been Lisp machines (Symbolics, Connection Machine, IT Explorer, others?)
Lisp as a functional language

(function-name arg1 arg2 etc)
1. Evaluate arguments
2. evaluate function with arguments
3. return the result

Functions as arguments to other functions:
(name2 (name1 arg1 arg2 etc) arg3 arg2 etc)

Symbolic language

- Atoms: numeric atoms (numbers), symbolic atoms (symbols)
  Each symbol has: print-name, plist, package, symbol-value, symbol-function

- Lists:

Symbolic expressions: symbols and lists
More constructs

- Data types:
  atoms and lists, packages, strings, structures, vectors,
  bit-vectors, arrays, streams, hash-tables, classes (CLOS), etc.
  NIL, T, numbers, strings: special symbols, evaluate to self

- Basic functions:
  first (car), rest (cdr), second, tenth
  setf: does not evaluate first argument
  cons, append, equal, operations on sets, etc.

- Basic macros:
  defun, defmacro, defstruct, defclass, defmethod,
  defvar, defparameter

- Special forms:
  let, let*, flet, labels, progn,

- Predicates:
  listp, endp, atom, numberp, symbolp, evenp, oddp, etc.

- Conditionals:
  if <test> <then form> <else form>,
  when <test> <then form>,
  unless <test> <else form>,
  cond,
  case

- Looping constructs:
  dolist, dotimes, do, mapcar, loop,

- Lambda functions
A really functional language

(defun <function-name> <arg1> <arg2> <arg3> ...
(flet ([local-function-name <arg a> <arg b> ....

.........
<return some value>]
)

.........
#'(lambda (x) ...........)...)..)

<some-value>)

(..........

Regular function
Anonymous function
Local function

defun, flet/labels, lambda

What makes Lisp different?

Paradigms of AI Programming, Norvig

- Built-in support for lists
- Dynamic storage management (garbage collection!)
- Dynamic typing
- First-class functions (dynamically created, anonymous)
- Uniform syntax
- Interactive environment
- Extensibility
Allegro Common Lisp

- Free download: www.franz.com/downloads/
- Available on SunOS (csce.unl.edu), and Linux.
- Great integration with emacs
  Check www.franz.com/emacs/ Check commands distributed by instructor
- Great development environment
  Composer: debugger, inspector, time/space profiler, etc.
  (require 'composer)
