

## Homework 4

**Assigned on:** Friday February 10, 2006.

**Due:** Friday, February 24, 2005.

All exercises are pen and paper (you may also type, however you should turn in the exercises in class) except for the two programming questions (i.e., Exercise 1 and 4), which must be submitted with **handin**.

**Value:** 96 points for ugrads and 100 points for grads.

---

### 1 Implementing a simple-reflex agent. Total: 15 points

- Write in Common Lisp a function that ‘models’ the simple-reflex agent for the vacuum-cleaner problem in an environment with two locations, as summarized on page 5 of the Instructor’s notes #4. The function should take as input the percepts of the agent as location of the agent and status of the room.
- Write a Common Lisp function that takes any of the 8 possible states of the vacuum-cleaner of Figure 3.20 of AIMA and runs the simple-reflect agent until the goal is reached.
- Design a performance measure that penalizes the agent for each step and each suck action. Record the agent performance for each one of the above 8 possible states.

### 2 AIMA, Exercise 3.7, Page 90. Total 8/12 points

- a: for ugrads and grads. 4 points
- b: for ugrads and grads. 4 points
- d: grads (bonus for ugrads). 4 points

### 3 AIMA, Exercise 3.8, Page 90. Total: 10 points

### 4 AIMA, Exercise 3.9, Page 90. Total: 38 points

- Question a: 6 points
- Question b: 30 points. You need to implement your algorithm in Common Lisp.
- Question c: 2 points

## 5 Evaluation function. Total: 6 points

Adapted from AIMA, Edition 1.

With  $g(n)$  being the path length,

1. Suppose that we run a greedy search algorithm with  $h(n) = -g(n)$ . What sort of search will the greedy search emulate?  
Explain. 3 points
2. Suppose that we run a search algorithm with  $h(n) = g(n)$ . What sort of search will the greedy search emulate?  
Explain. 3 points

## 6 AIMA, Exercise 4.1, Page 134. Total: 10 points

## 7 AIMA, Exercise 4.3, Page 134. Total: 9 points
