Outline

- First-order logic:
  - basic elements
  - syntax
  - semantics
- Examples
Pros and cons of propositional logic

- Propositional logic is **declarative**: pieces of syntax correspond to facts
- Propositional logic allows partial/disjunctive/negated information
  (unlike most data structures and databases)
- Propositional logic is **compositional**:
  meaning of $B_{1,1} \land P_{1,2}$ is derived from meaning of $B_{1,1}$ and of $P_{1,2}$
- Meaning in propositional logic is context-independent
  (unlike natural language, where meaning depends on context)
- but...
  Propositional logic has very limited expressive power
  E.g., cannot say “pits cause breezes in adjacent squares” except by writing one sentence for each square

Propositional Logic

- is simple
- illustrates important points:
  model, inference, validity, satisfiability, ..
- is restrictive: world is a set of facts
- lacks expressiveness:
  $\rightarrow$ In PL, world contains facts

First-Order Logic

- more symbols (objects, properties, relations)
- more connectives (quantifier)
First Order Logic

→ FOL provides more "primitives" to express knowledge:
  — objects (identity & properties)
  — relations among objects (including functions)

Objects: people, houses, numbers, Einstein, Huskers, event, ..
Properties: smart, nice, large, intelligent, loved, occurred, ..
Relations: brother-of, bigger-than, part-of, occurred-after, ..
Functions: father-of, best-friend, double-of, ..
Examples: (objects? function? relation? property?)
  — one plus two equals four [sic]
  — squares neighboring the wumpus are smelly

Logic

Attracts: mathematicians, philosophers and AI people

Advantages:
  — allows to represent the world and reason about it
  — expresses anything that can be programmed

Non-committal to:
  — symbols could be objects or relations
    (e.g., King(Gustave), King(Sweden, Gustave), Merciless(King))
  — classes, categories, time, events, uncertainty

.. but amenable to extensions: OO FOL, temporal logics, situation/event calculus, modal logic, etc.

→ Some people think FOL *is* the language of AI
  true/false? donno :—( but it will remain around for some time..
**Types of logic**

Logics are characterized by what they commit to as “primitives”

**Ontological commitment**: what exists—facts? objects? time? beliefs?

**Epistemological commitment**: what states of knowledge?

<table>

Higher-Order Logic: views relations and functions of FOL as objects

---

**Syntax of FOL**: words and grammar

The words: symbols

- Constant symbols stand for objects: QueenMary, 2, UNL, etc.
- Variable symbols stand for objects: $x$, $y$, etc.
- Predicate symbols stand for relations: Odd, Even, Brother, Sibling, etc.
- Function symbols stand for functions (viz. relation)
  Father-of, Square-root, LeftLeg, etc.
- Quantifiers $\forall$, $\exists$
- Connectives: $\land$, $\lor$, $\neg$, $\Rightarrow$, $\Leftrightarrow$
- (Sometimes) equality $=$

Predicates and functions can have any arity (number of arguments)
Basic elements in FOL (i.e., the grammar)

In propositional logic, every expression is a sentence

In FOL,

- Terms
- Sentences:
  - atomic sentences
  - complex sentences
- Quantifiers:
  - Universal quantifier
  - Existential quantifier

Term

logical expression that refers to an object

— built with: constant symbols, variables, function symbols

\[
\text{Term} = \text{function}(\text{term}_1, \ldots, \text{term}_n)
\]

or constant or variable

— ground term: term with no variable
**Atomic sentences**

state facts
built with terms and predicate symbols

\[ \text{Atomic sentence} = \text{predicate}(\text{term}_1, \ldots, \text{term}_n) \]

or \( \text{term}_1 = \text{term}_2 \)

**Examples:**

Brother (Richard, John)
Married (FatherOf(Richard), MotherOf(John))

**Complex Sentences**

built with atomic sentences and logical connectives

\( \neg S \)
\( S_1 \land S_2 \)
\( S_1 \lor S_2 \)
\( S_1 \Rightarrow S_2 \)
\( S_1 \Leftrightarrow S_2 \)

**Examples:**

Sibling(KingJohn, Richard) \( \Rightarrow \) Sibling(Richard, KingJohn)
\( > (1, 2) \lor \leq (1, 2) \)
\( > (1, 2) \land \neg > (1, 2) \)
Truth in first-order logic: Semantic

Sentences are true with respect to a model and an interpretation.

Model contains objects and relations among them.

Interpretation specifies referents for:
- constant symbols → objects
- predicate symbols → relations
- function symbols → functional relations

An atomic sentence `predicate(term_1, ..., term_n)` is true if the objects referred to by `term_1, ..., term_n` are in the relation referred to by `predicate`.

Model in FOL: example

The domain of a model is the set of objects it contains: five objects.

Intended interpretation: Richard refers to Richard the Lion Heart, John refers to Evil King John, Brother refers to brotherhood relation, etc.
**Models for FOL: Lots!**

We can enumerate the models for a given KB vocabulary:

For each number of domain elements \( n \) from 1 to \( \infty \)
   For each \( k \)-ary predicate \( P_k \) in the vocabulary
      For each possible \( k \)-ary relation on \( n \) objects
         For each constant symbol \( C \) in the vocabulary
            For each choice of referent for \( C \) from \( n \) objects ... 

Computing entailment by enumerating models is not going to be easy!

There are many possible interpretations, also some model domain are not bounded

\( \rightarrow \) Checking entailment by enumerating is not an option

---

**Quantifiers**

allow to make statements about entire collections of objects

- universal quantifier: make statements about **everything**
- existential quantifier: make statements about **some things**
**Universal quantification**

\[ \forall \langle \text{variables} \rangle \langle \text{sentence} \rangle \]

**Example:** all dogs like bones \( \forall x \text{Dog}(x) \Rightarrow \text{LikeBones}(x) \)

\( x = \text{Indy} \) is a dog \quad \( x = \text{Indiana Jones} \) is a person

\( \forall x \ P \) is equivalent to the conjunction of instantiations of \( P \)

\[
\begin{align*}
\text{Dog}(\text{Indy}) & \Rightarrow \text{LikeBones}(\text{Indy}) \\
\land \quad \text{Dog}(\text{Rebel}) & \Rightarrow \text{LikeBones}(\text{Rebel}) \\
\land \quad \text{Dog}(\text{KingJohn}) & \Rightarrow \text{LikeBones}(\text{KingJohn}) \\
\land \quad \ldots 
\end{align*}
\]

**Typically:** \( \Rightarrow \) is the main connective with \( \forall \)

**Common mistake:** using \( \land \) as the main connective with \( \forall \)

Example: \( \forall x \ \text{Dog}(x) \land \text{LikeBones}(x) \)

all objects in the world are dogs, and all like bones

---

**Existential quantification**

\[ \exists \langle \text{variables} \rangle \langle \text{sentence} \rangle \]

**Example:** some student will talk at the TechFair

\( \exists x \text{Student}(x) \land \text{TalksAtTechFair}(x) \)

Pat, Leslie, Chris are students

\( \exists x \ P \) is equivalent to the disjunction of instantiations of \( P \)

\[
\begin{align*}
\text{Student}(\text{Pat}) & \land \text{TalksAtTechFair}(\text{Pat}) \\
\lor \quad \text{Student}(\text{Leslie}) & \land \text{TalksAtTechFair}(\text{Leslie}) \\
\lor \quad \text{Student}(\text{Chris}) & \land \text{TalksAtTechFair}(\text{Chris}) \\
\lor \quad \ldots 
\end{align*}
\]

**Typically:** \( \lor \) is the main connective with \( \exists \)

**Common mistake:** using \( \Rightarrow \) as the main connective with \( \exists \)

\( \exists x \text{Student}(x) \Rightarrow \text{TalksAtTechFair}(x) \)

is true if there is anyone who is not Student
Properties of quantifiers (I)

∀x ∀y is the same as ∀y ∀x
∃x ∃y is the same as ∃y ∃x
∃x ∀y is not the same as ∀y ∃x
∃x ∀y Loves(x, y)
“There is a person who loves everyone in the world”
∀y ∃x Loves(x, y)
“Everyone in the world is loved by at least one person”

Quantifier duality: each can be expressed using the other
∀x Likes(x, IceCream)  ¬∃x ¬Likes(x, IceCream)
∃x Likes(x, Broccoli)  ¬∀x ¬Likes(x, Broccoli)

Parsimony principal: ∀, ¬, and ⇒ are sufficient

Properties of quantifiers (II)

Nested quantifier:
∀ x(∃ y(P(x, y)):
every object in the world has a particular property, which is the
property to be related to some object by the relation P
∃ x (∀ y(P(x, y)):
there is some object in the world that has a particular property,
which is the property to be related to every object by the relation P

Lexical scoping: ∀ x[Cat(x) ∨ ∃ xBrother(Richard, x)]

Well-formed formulas (WFF): (kind of correct spelling)
every variable must be introduced by a quantifier
∀ xP(y) is not a WFF
Examples

Brothers are siblings

“Sibling” is symmetric

One’s mother is one’s female parent

A first cousin is a child of a parent’s sibling

∀x, y Brother(x, y) ⇒ Sibling(x, y)

∀x, y Sibling(x, y) ⇒ Sibling(y, x)

∀x, y Mother(x, y) ⇒ (Female(x) ∧ Parent(x, y))

∀x, y FirstCousin(x, y) ⇔
∃a, b Parent(a, x) ∧ Sibling(a, b) ∧ Parent(b, y)
**Tricky example**

Someone is loved by everyone
\[ \exists x \forall y \text{Loves}(y, x) \]

Someone with red-hair is loved by everyone
\[ \exists x \forall y \text{Redhair}(x) \land \text{Loves}(y, x) \]

Alternatively:
\[ \exists x \text{Person}(x) \land \text{Redhair}(x) \land (\forall y \text{Person}(y) \Rightarrow \text{Loves}(y, x)) \]

**Equality**

\( \text{term}_1 = \text{term}_2 \) is true under a given interpretation if and only if \( \text{term}_1 \) and \( \text{term}_2 \) refer to the same object.

Examples

- Father(John) = Henry
- 1 = 2 is satisfiable
- 2 = 2 is valid
- Useful to distinguish two objects:
  - Definition of (full) Sibling in terms of Parent:
    \[ \forall x, y \text{Sibling}(x, y) \leftrightarrow [\neg(x = y) \land \exists m, f \neg(m = f) \land \text{Parent}(m, x) \land \text{Parent}(f, x) \land \text{Parent}(m, y) \land \text{Parent}(f, y)] \]
  - Spot has at least two sisters: ...

AIMA, Exercise 8.4 & 8.7
Knowledge representation (KR)

**Domain:** a section of the world about which we wish to express some knowledge

**Example:** Family relations (kinship):
- Objects: people
- Properties: gender, married, divorced, single, widowed
- Relations: parenthood, brotherhood, marriage..

**Unary predicates:** Male, Female

**Binary relations:** Parent, Sibling, Brother, Child, etc.

**Functions:** Mother, Father

\[ \forall m, c, \text{Mother}(c) = m \iff \text{Female}(m) \land \text{Parent}(m, c) \]

In Logic (informally)

- Basic facts: **axioms** (definitions)
- Derived facts: **theorems**

**Independent axiom**

an axiom that cannot be derived from the rest

\[ \rightarrow \text{Goal of mathematicians: find the minimal set of independent axioms} \]

In AI

- Assertions: sentences added to a KB using TELL
- Queries or goals: sentences asked to KB using ASK
Interacting with FOL KBs

Suppose a wumpus-world agent is using an FOL KB and perceives a smell and a breeze (but no glitter) at $t = 5$:

Tell($KB$, Percept([$Smell$, $Breeze$, None], 5))

Ask($KB$, $\exists a$Action($a$, 5))

I.e., does the KB entail any particular actions at $t = 5$?

Answer: Yes, $\{a/$Shoot$\} \leftarrow$ substitution (binding list)

Given a sentence $S$ and a substitution $\sigma$,

$S\sigma$ denotes the result of plugging $\sigma$ into $S$; e.g.,

$S = Smarter(x, y)$

$\sigma = \{x/$Hillary, $y/$Bill$\}$

$S\sigma = Smarter($Hillary, $Bill$)$

Ask($KB, S$) returns some/all $\sigma$ such that $KB \models S\sigma$

---

Prepare for next lecture: AIMA, Exercise 8.6, page 268

Takes($x, c, s$): student $x$ takes course $c$ in semester $s$

Passes($x, c, s$): student $x$ passes course $c$ in semester $s$

Score($x, c, s$): the score obtained by student $x$ in course $c$ in semester $s$

xy: $x$ is greater than $y$

$F$ and $G$: specific French and Greek courses

Buys($x, y, z$): $x$ buys $y$ from $z$

Sells($x, y, z$): $x$ sells $y$ from $z$

Shaves($x, y$): person $x$ shaves person $y$

Born($x, c$): person $x$ is born in country $c$

Parent($x, y$): person $x$ is parent of person $y$

Citizen($x, c, r$): person $x$ is citizen of country $c$ for reason $r$

Resident($x, c$): person $x$ is resident of country $c$ of person $y$

Fools($x, y, t$): person $x$ fools person $y$ at time $t$

Student ($x$), Person ($x$), Man ($x$), Barber ($x$), Expensive ($x$), Agent ($x$), Insured ($x$), Smart ($x$), Politician ($x$),
AI Limerick

If your thesis is utterly vacuous
Use first-order predicate calculus
With sufficient formality
The sheerest banality
Will be hailed by the critics: "Miraculous!"
