- if statements

## Control Structure

CSCE150A

#### Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

## Control structures:

- Control the flow of execution in a program or function.
- Enable you to combine individual instructions into a single logical unit with one entry point (i.e. int main(void) {) and one exit point (return 0; }).
- Three kinds of structures to control execution flow:
  - Sequence
  - Selection
  - Repetition

## Sequential Flow

### CSCE150A

#### Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

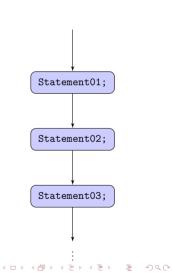

Nested if Statements

switch Statement

Review

## Compound statement:

- Written as a group of statements
- Bracketed by { and }
- Used to specify sequential flow
- All statements are unconditionally executed
- Order is important

## Selection Flow

#### CSCE150A

#### Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

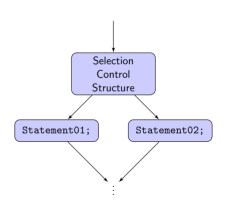

Nested if Statements

switch Statement

Review

## Selection control structure:

- Evaluates criteria to determine which alternative "path" to follow
- A control structure determines which statement(s) to execute
- Statements are mutually exclusive

## Selection Flow - Conditions

## CSCE150A

## Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

## Definition

A condition is an expression that is either true or false.

A program chooses alternative paths of computation by testing one or more conditions.

- (ConditionEval == 1) → true,
- (ConditionEval == 0)  $\rightarrow$  false.
- The resting heart rate is a good indicator of health
- if (resting\_heart\_rate < 75) then you are in good health.
  - if resting heart rate is 80, ConditionEval is false.
  - if resting heart rate is 50, ConditionEval is true.
  - if resting heart rate is 75, what is ConditionEval?

# Relational and Equality Operators

CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

Operator	Meaning	Туре
<	less than	relational
>	greater than	relational
<=	less than or equal to	relational
>=	greater than or equal to	relational
==	equal to	equality
!=	not equal to	equality

Table: Relational and Equality Operators in C

# Relational and Equality Operators

## CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

## Conditions come in four forms:

- variable relational-operator variable
- Example: if(numberOfStudents > numberOfSeats)
- variable relational-operator CONSTANT
- Example: if(numberOfStudents < 5)
- variable equality-operator variable
- Example: if(numberOfStudents == numberOfSeats)
- variable equality-operator CONSTANT
- Example: if (averageGrade == 75.0)

What about more than one condition? (Example:  $0 \le x \le 10$ )

# Logical Operators

CSCE150A

Nested if Statements

switch Statement

Review

**Logical Expressions** - expressions that involve conditional statement(s) and logical operator(s).

## Examples:

- $\bullet$  (x >= 0 && x <=10)
- (temperature > 90.0 && humidity > 0.90)
- !(x >= 0 && x <=10)

What about the following: Are we going to go or not?

```
(go || !go)
```

## Tautologies & Contradictions

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- A tautology is a logical expression that is always true
  - Any non-zero constant (1, 1.5, 8, etc.)
  - An expression that, when simplified, always ends up being true
    - (go || !go) is always true
- A contradiction is a logical expression that is always false
  - The zero constant (0)
  - An expression that, when simplified, always ends up being false
    - (go && !go) is always false

# Distributivity

## CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

• The logical AND can be *distributed* over a logical expression just as multiplication can be over an algebraic expression.

- $\bullet \ a(b+c) = ab + ac$
- a && (b || c) is same as (a && b) || (a && c)
  - (Here, a, b, and c are relations like x < 5)
- When distributing the logical Not, And and OR are reversed!
- Example:
  - !(x >= 0 && x <=10)
  - (!(x >= 0) || !(x <=10))
  - ((x < 0) || (x > 10))

Best to simplify logical expressions as much as possible, but more important to keep code readable.

# True and False

### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- For convenience when writing we identify zero with false and one with true
- C does not recognize the words true, false
- C has no built-in Boolean type!
- Instead, zero is identified with false
- Any non-zero value is identified with true
- Example: -1, 0.01, 386 are all true

# Operator Tables Logical AND

CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

The result of taking a logical  $A{\rm ND}$  with two operands is true if and only if both operands are true. Otherwise it is false.

Operand A	Operand B	Result
0	0	0
0	1	0
1	0	0
1	1	1

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

The result of taking a logical OR with two operands is true if and only if at least one of the operands is true. Otherwise it is false.

Operand A	Operand B	Result
0	0	0
0	1	1
1	0	1
1	1	1

# Operator Tables Logical AND

CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

You can only apply a logical NOT to a single operand. The result is that true gets flipped to false and vice versa.

Operand	Result	
0	1	
1	0	

# Operator Precedence

## CSCE150A

Order of precedence for operators

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

```
Precedence
           Operator
High
           Function calls
            ! + - & (unary)
           + - (binary)
           < <= >= >
               1=
           &&
Low
```

Table: Order of Precedence for Operators

# **Short-Circuiting**

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- If the first operand of a logical OR is true, the whole expression is true regardless of the second operand.
- Similarly, if the first operand of a logical AND is false, the whole expression is false regardless of the second operand.
  - (true || anything) is true
  - (false && anything) is false
- By convention, in either case C does not bother to evaluate the second operand.
- This is known as short-circuiting

# Programming Tip

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- Writing pseudocode will help you to write logical expressions in plain English.
- Translate the expressions into valid C syntax
- Be sure that the original and the translation are logically equivalent
- You can use a **int** type to store true/false:

```
int someBoolean = 0;
```

### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- Recall that C uses partially weak typing
- ullet C treats characters as integers in the range [0,255]
- Thus, it makes sense that we can compare characters using relational and equality operators.
- Comparisons are based on the values used to encode letters (typically ASCII; Appendix A)
- ullet Example: 'a' < 'e' is true since (in ASCII) 97 < 101

- if Statement with One Alternative
- A Comparison of One and Two Alternative if Statements
- Programming Style

## If-Then-Else Statement

### CSCE150A

#### Introduction

Relational Operators

Logical Operators

Comparing Characters

#### if Statement

Nested if Statements

switch Statement

- Conditions are used to assign **boolean** (T,F) values to variables
- Example: senior\_citizen = (age >= 65)
- $\bullet$  0 or 1 is assigned to  ${\tt senior\_citizen}$  depending on the value of age
- More often, conditions are used to make a choice between alternatives, through the if statement.
- If the condition is true, one statement is executed, otherwise, another statement is executed.

```
if (!senior_citizen)
printf("Your hamburger is $3.50\n");
else
printf("Your hamburger is $2.50\n");
```

## if Statement with One Alternative

### CSCE150A

#### Introduction

Relational Operators

Logical Operators

Comparing Characters

#### if Statement

Nested if Statements

switch Statement

- It is not necessary to specify an alternative (else statement)
- An if statement can determine to execute a statement or not

```
if(senior_citizen)
price = price - 1.0;
```

# Programming Tip

## CSCE150A

#### Introduction

Relational Operators

Logical Operators

Comparing Characters

#### if Statement

Nested if Statements

switch Statement

- Recall that division by zero is undefined (and dangerous)
- You can use an if statement to avoid such errors

```
1 if(x != 0)
2 quotient = quotient / x;
```

# Program Style

### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- Statements following the if statements should be indented
- else statement is at the same indentation as the if statement
- Statements following the else statements should be indented

# Programming Tip

### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

#### if Statement

Nested if Statements

switch Statement

Review

Pitfall: Do not end an if statement with a semi-colon:

```
1 if(price < 0);
2 printf("The product is free!\n");</pre>
```

- Syntactically correct; program will compile
- Essentially like if (price<0) {};
- Will not give expected results
- The if statement is ended by the semicolon
- Thus, "The product is free!" will be printed regardless of the value of price

# if Statement with Compound Statements

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

## if Statement

Nested if Statements

switch Statement

- In previous slides, if and else statements have performed only one operation
- C always assumes that each if or else statement will be followed by one operation
- If more than one statement needs to be done for an if or else, we use {} to group a set of statements into one compound statement

# if Statement with Compound Statements

Comparing Characters

## if Statement

Nested if Statements

switch Statement

Review

```
if (crash_test_rating_index <= MAX_SAFE_CTRI)</pre>
      printf("Car #%d: safe\n", auto_id);
4
      numOfSafeCars = numOfSafeCars + 1:
5
6
   else
8
      printf("Car #%d: unsafe\n", auto_id);
9
      numOfUnsafeCars = numOfUnsafeCars + 1;
10
```

If you omit the braces, what happens?

## Tracing an if Statement

### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- Verifying the correctness of a C statement before running the program
- Catching logical errors will save a lot of time in debugging.
- A hand trace or desk check is a step-by-step simulation of each step
  of the program, as well as how the values of the variables change at
  each step.

# Nested if Statements and Multiple-Alternative Decisions

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

### if Statement

Nested if Statements

switch Statement

- No decisions: Sequential program
- One decision: if-then (One alternative)
  - if(cond) statement;
- Decision between two alternatives: if-then-else (Two alternative statements)
  - if(cond) statement; else statement2;
- Decisions between many alternatives
  - School level

# Nested if Statements and Multiple-Alternative Decisions

#### CSCE150A

```
Introduction
```

Relational Operators

Logical Operators

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

### Can instead use a sequence of if statements

```
1  if(x <= 0)
2    pre_school = pre_school + 1;
3  if(x <= 12 && x > 0)
4    public_school = public_school + 1;
5  if(x > 12)
6    univ = univ + 1;
```

# Nested ifs vs. Sequence of ifs II

### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- Not as readable: since the sequence does not clearly show that exactly one of the three assignment statements is executed for a particular x.
- Less efficient because all three of the conditions are always tested. In the nested if statement, only the first condition is tested when x is not positive.
- Can lead to logical errors

# Nested ifs vs. Sequence of ifs III

### CSCE150A

```
Introduction

Operators

Comparing

Characters

if Statement

Nested if Statements

switch

Statement

Logical Operators Better solution: the if-else-if statement

```
if (condition 1)
      statement 1
3
   else if ( condition_2 )
4
      statement 2
5
6
   else if ( condition n )
8
      statement_n
9
   else
10
      statement_e
```

# Example Range Elimination

CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

We want to describe noise loudness measured in decibels with the effect of the noise. The following table shows the relationship between noise level and human perceptions of noises.

Loudness in Decibels (db)	Perception
50 or lower	quiet
51 - 70	intrusive
71 - 90	annoying
91 - 110	very annoying
above 110	uncomfortable

Table:

# Example in C code

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

 $if\ Statement\\$ 

Nested if Statements

switch Statement

```
if (loudness \leq 50)
      printf("quiet");
   else if (loudness <= 70)
4
      printf("intrusive");
5
   else if ( loudness <= 90 )
6
      printf("annoying");
   else if (loudness <= 110)
8
      printf("very annoying");
9
   else
10
      printf("uncomfortable");
```

# Multiple-Alternative if, Order of Conditions

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- With if-else-if statements, one and only one statement is ever executed
- Moreover the *first* satisfied condition is the one that is executed
- The order of the conditions can affect the outcome
- The order of conditions also affect program efficiency
- The most common cases (if known) should be checked first
  - If loud noises are much more likely, it is more efficient to test first for noise levels above 110 db, then for levels between 91 and 110 db, and so on.

### Code Exercise

Nested if Statements

switch Statement

Review

Avoids overhead of executing the "then" part of each **if** statement in previous solution

### Switch

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- The switch statement is similar to a multiple-alternative if statement, but can be used only for type char or type int expressions.
- Useful when the selection depends on the value of a single variable (called the controlling variable)
- Expressions in the switch statement must cover all possible values
  of the controlling variable.
  - $\bullet \ \ \mathsf{Each \ viable \ expression} \ \to \ \ \mathsf{case} \ \mathsf{statement}$
  - All other values → fall-through (default:) statement.

# Switch Example

```
#include <stdio.h>
 CSCE150A
                 int main(void)
              3
                 char class:
Introduction
              5
                 scanf("%c", &class);
              6
                 switch (class)

             20
```

←□ > ←□ > ← □ > ← □ >

### Common Errors

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- You cannot use a **string** such as "Cruiser" or "Frigate" as a case label.
- The omission of the break statement at the end of an alternative causes the execution to "fall through" into the next alternative.
- Forgetting the closing brace of the switch statement body.

### Nested if versus switch

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

Review

### • A nested **if** is more general then a **switch** statement

- if: Can check any number of any data type variables vs. one value for int or char data type.
- if: Can use a range of values, such as < 100
- switch: More readable
- switch: Can not compare strings or double types
- switch: Can not handle a range of values in one case label
- Use the switch whenever there are ten or fewer case labels
- Use the default label whenever possible

# Common Programming Errors I

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- (0 <= x <= 4) is always true
  - Associativity: first 0 <= x is evaluated (true or false)</li>
  - Thus, it evaluates to either 1 or and 0
  - In either case, both are less than 4
  - Thus the entire expression is true regardless of the value of x
- if (x = 10) is always true: the assignment operator is evaluated and x is given a value of 10, which is true

# Common Programming Errors II

#### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- Don't forget to parenthesize the condition.
- Don't forget the opening and closing brackets, { } if they are needed.
- When doing nested if statement, try to select conditions so that you can use the range-elimination multiple-alternative format.
- C matches each else with the closest unmatched if, so be careful so that you get the correct pairings of if and else statements.
  - Can insert curly braces to get the desired behavior

# Common Programming Errors III

### CSCE150A

Introduction

Relational Operators

Logical Operators

Comparing Characters

if Statement

Nested if Statements

switch Statement

- In switch statements, make sure the controlling expression and case labels are of the same permitted type.
- Remember to include the default case for switch statements.
- Don't forget the opening and closing brackets, { } for the switch statement.
- Don't forget the break statement.
