

NII52010-10.0.0

#### Introduction

This chapter provides an alphabetically ordered list of all the functions in the hardware abstraction layer (HAL) application program interface (API). Each function is listed with its C prototype and a short description. Each listing provides information about whether the function is thread-safe when running in a multi-threaded environment, and whether it can be called from an interrupt service routine (ISR).

This chapter only lists the functionality provided by the HAL. The complete newlib API is also available from within HAL systems. For example, newlib provides printf(), and other standard I/O functions, which are not described here.

 For more details about the newlib API, refer to the newlib documentation. On the Windows Start menu, click Programs > Altera > Nios II > Nios II Documentation.

#### **HAL API Functions**

The HAL API functions are shown on the following pages.

## \_exit()

Prototype:	<pre>void _exit (int exit_code)</pre>
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The newlib $exit()$ function calls the $_exit()$ function to terminate the current process. Typically, $exit()$ calls this function when $main()$ completes. Because there is only a single process in HAL systems, the HAL implementation blocks forever.
	Improvement of the second seco
	The input argument, exit_code, is ignored.
Return:	-
See also:	Newlib documentation

#### \_rename()

Prototype:	int _rename(char *existing, char* new)
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<stdio.h></stdio.h>
Description:	The $\_rename()$ function is provided for newlib compatibility.
Return:	It always fails with return code $-1$ , and with errno set to ENOSYS.
See also:	Newlib documentation

## alt\_alarm\_start()

Prototype:	<pre>int alt_alarm_start   ( alt_alarm* alarm,     alt_u32    nticks,     alt_u32    (*callback) (void* context),     void*</pre>	
Commonly called by:	C/C++ programs	
	Device drivers	
Thread-safe:	Yes.	
Available from ISR:	Yes.	
Include:	<sys alt_alarm.h=""></sys>	
Description:	The alt_alarm_start() function schedules an alarm callback. Refer to "Using Timer Devices" in the <i>Developing Programs Using the Hardware Abstraction Layer</i> chapter of the <i>Nios® II Software Developer's Handbook</i> . The HAL waits ntick system clock ticks before callin the callback() function. When the HAL calls callback(), it passes it the input argum context.	
	The alarm argument is a pointer to a structure that represents this alarm. You must create it, and it must have a lifetime that is at least as long as that of the alarm. However, you are not responsible for initializing the contents of the structure pointed to by alarm. This action is done by the call to alt_alarm_start().	
Return:	The return value for alt_alarm_start() is zero on success, and negative otherwise. This function fails if there is no system clock available.	
See also:	alt_alarm_stop()	
	alt_nticks()	
	alt_sysclk_init()	
	alt_tick()	
	alt_ticks_per_second()	
	gettimeofday()	
	settimeofday()	
	times()	
	usleep()	

## alt\_alarm\_stop()

Prototype:	void alt_alarm_stop (alt_alarm* alarm)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_alarm.h=""></sys>
Description:	You can call the alt_alarm_stop() function to cancel an alarm previously registered by a call to alt_alarm_start(). The input argument is a pointer to the alarm structure in the previous call to alt_alarm_start().
	On return the alarm is canceled, if it is still active.
Return:	-
See also:	alt_alarm_start()
	alt_nticks()
	alt_sysclk_init()
	alt_tick()
	alt_ticks_per_second()
	gettimeofday()
	settimeofday()
	times()
	usleep()

## alt\_dcache\_flush()

Prototype:	void alt_dcache_flush (void* start, alt_u32 len)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_cache.h=""></sys>
Description:	The alt_dcache_flush() function flushes the data cache for a memory region of length len bytes, starting at address start. Flushing the cache consists of writing back dirty data and then invalidating the cache.
	In processors without data caches, it has no effect.
Return:	-
See also:	alt_dcache_flush_all()
	alt_icache_flush()
	alt_icache_flush_all()
	alt_remap_cached()
	alt_remap_uncached()
	alt_uncached_free()
	alt_uncached_malloc()

## alt\_dcache\_flush\_all()

Prototype:	void alt_dcache_flush_all (void)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_cache.h=""></sys>
Description:	The $alt_dcache_flush_all()$ function flushes, that is, writes back dirty data and then invalidates, the entire contents of the data cache.
	In processors without data caches, it has no effect.
Return:	-
See also:	alt_dcache_flush()
	alt_icache_flush()
	alt_icache_flush_all()
	alt_remap_cached()
	alt_remap_uncached()
	alt_uncached_free()
	alt_uncached_malloc()

## alt\_dev\_reg()

Prototype:	int alt_dev_reg(alt_dev* dev)
Commonly called by:	Device drivers
Thread-safe:	No.
Available from ISR:	No.
Include:	<sys alt_dev.h=""></sys>
Description:	The alt_dev_reg() function registers a device with the system. After it is registered, you can access a device using the standard I/O functions. Refer to the <i>Developing Programs Using the Hardware Abstraction Layer</i> chapter of the <i>Nios II Software Developer's Handbook</i> .
	The system behavior is undefined in the event that a device is registered with a name that conflicts with an existing device or file system.
	The $alt\_dev\_reg()$ function is not thread-safe in the sense that no other thread can use the device list at the time that $alt\_dev\_reg()$ is called. Call $alt\_dev\_reg()$ only in the following circumstances:
	When running in single-threaded mode.
	<ul> <li>From a device initialization function called by alt_sys_init().alt_sys_init() may only be called by the single-threaded C startup code.</li> </ul>
Return:	The return value is zero upon success. A negative return value indicates failure.
See also:	alt_fs_reg()

## alt\_dma\_rxchan\_close()

Prototype:	int alt_dma_rxchan_close (alt_dma_rxchan rxchan)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_dma.h=""></sys>
Description:	The alt_dma_rxchan_close() function notifies the system that the application has finished using the direct memory access (DMA) receive channel, rxchan. The current implementation always succeeds.
Return:	The return value is zero on success and negative otherwise.
See also:	alt_dma_rxchan_depth()
	alt_dma_rxchan_ioctl()
	alt_dma_rxchan_open()
	alt_dma_rxchan_prepare()
	alt_dma_rxchan_reg()
	alt_dma_txchan_close()
	alt_dma_txchan_ioctl()
	alt_dma_txchan_open()
	alt_dma_txchan_reg()
	alt_dma_txchan_send()
	alt_dma_txchan_space()

# alt\_dma\_rxchan\_depth()

Prototype:	alt_u32 alt_dma_rxchan_depth(alt_dma_rxchan dma)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_dma.h=""></sys>
Description:	The alt_dma_rxchan_depth() function returns the maximum number of receive requests that can be posted to the specified DMA transmit channel, dma.
	Whether this function is thread-safe, or can be called from an ISR, depends on the underlying device driver. In general it safest to assume that it is not thread-safe.
Return:	Returns the maximum number of receive requests that can be posted.
See also:	alt_dma_rxchan_close()
	alt_dma_rxchan_ioctl()
	alt_dma_rxchan_open()
	alt_dma_rxchan_prepare()
	alt_dma_rxchan_reg()

	<pre>alt_dma_txchan_space()</pre>		

Request	Meaning	
ALT_DMA_SET_MODE_8	Transfer data in units of 8 bits. The value of arg is ignored.	
ALT_DMA_SET_MODE_16	Transfer data in units of 16 bits. The value of arg is ignored.	
ALT_DMA_SET_MODE_32	Transfer data in units of 32 bits. The value of arg is ignored.	
ALT_DMA_SET_MODE_64	Transfer data in units of 64 bits. The value of arg is ignored.	
ALT_DMA_SET_MODE_128	Transfer data in units of 128 bits. The value of arg is ignored.	
ALT_DMA_GET_MODE	Return the transfer width. The value of arg is ignored.	
ALT_DMA_TX_ONLY_ON	The ALT_DMA_TX_ONLY_ON request causes a DMA channel to operate in a mode in which only the transmitter is under software control. The other side writes continuously from a single location. The address to which to write is the argument to this request.	
ALT_DMA_TX_ONLY_OFF	Return to the default mode, in which both the receive and transmit sides of the DMA can be under software control.	
ALT_DMA_RX_ONLY_ON	The ALT_DMA_RX_ONLY_ON request causes a DMA channel to operate in a mode in which only the receiver is under software control. The other side reads continuously from a single location. The address to read is the argument to this request.	
ALT_DMA_RX_ONLY_OFF	Return to the default mode, in which both the receive and transmit sides of the DMA can be under software control.	

#### Table 14–1. Generic Requests

## alt\_dma\_rxchan\_open()

Prototype:	alt_dma_rxchan alt_dma_rxchan_open (const char* name)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_dma.h=""></sys>
Description:	The alt_dma_rxchan_open() function obtains an alt_dma_rxchan descriptor for a DMA receive channel. The input argument, name, is the name of the associated physical device, for example, /dev/dma_0.
Return:	The return value is null on failure and non-null otherwise. If an error occurs, errno is set to ENODEV.

	<pre>alt_write_flash_block()</pre>		

## alt\_exception\_cause\_generated\_bad\_addr()

Prototype:	int alt_exception_cause_generated_bad_addr
	( alt_exception_cause cause)
Commonly called by:	Instruction-related exception handlers
Thread-safe:	
Available from ISR:	
Include:	<sys alt_exceptions.h=""></sys>
Description:	This function validates the bad_addr argument to an instruction-related exception handler. The function parses the handler's cause argument to determine whether the bad_addr register contains the exception-causing address.
	If the exception is of a type that generates a valid address in bad_addr, this function returns a nonzero value. Otherwise, it returns zero.
	If the cause register is unimplemented in the Nios II processor core, this function always returns zero.
Return:	A nonzero value means bad_addr contains the exception-causing address.
	Zero means the value of bad_addr is to be ignored.
See also:	alt_instruction_exception_register()

## alt\_flash\_close\_dev()

Commonly called by: C/C++ programs Device drivers Thread-safe: No. Available from ISR: No. Include: Cys/alt_flash.h> Description: The alt_flash_close_dev() function closes a flash device. All subsequent calls to alt_write_flash(), alt_read_flash(), alt_get_flash_info(), alt_erase_flash_block(), or alt_write_flash_block() for this flash device fail. Call the alt_flash_close_dev() function only when operating in single-threaded mode. The only valid values for the fd parameter are those returned from the alt_flash_open_dev function. If any other value is passed, the behavior of this function is undefined. Return: See also: alt_erase_flash_block() alt_get_flash_info() alt_read_flash() alt_write_flash() alt_write_flash() alt_write_flash_block()	Prototype:	void alt flash close dev(alt flash fd* fd)
Device driversThread-safe:No.Available from ISR:No.Include: <sys alt_flash.h="">Description:The alt_flash_close_dev() function closes a flash device. ## alt\_flash\_open\_dev()

Prototype:	alt_flash_fd* alt_flash_open_dev(const char* name)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	No.
Available from ISR:	No.
Include:	<sys alt_flash.h=""></sys>
Description:	The <code>alt_flash_open_dev()</code> function opens a flash device. After it is opened, you can perform the following operations:
	Write to a flash device using alt_write_flash()
	Read from a flash device using alt_read_flash()
	Control individual flash blocks using alt_get_flash_info(), alt_erase_flash_block(), Or alt_write_flash_block().
	Call the <code>alt_flash_open_dev</code> function only when operating in single-threaded mode.
Return:	The return value is zero upon failure. Any other value indicates success.
See also:	alt_erase_flash_block()
	alt_flash_close_dev()
	alt_get_flash_info()
	alt_read_flash()
	alt_write_flash()
	alt_write_flash_block()

# alt\_fs\_reg()

Prototype:	int alt_fs_reg (alt_dev* dev)
Commonly called by:	Device drivers
Thread-safe:	No.
Available from ISR:	No.
Include:	<sys alt_dev.h=""></sys>
Description:	The alt_fs_reg() function registers a file system with the HAL. After it is registered, a file system can be accessed using the standard I/O functions. Refer to the <i>Developing Programs</i> Using the Hardware Abstraction Layer chapter of the Nios II Software Developer's Handbook.
	System behavior is undefined in the event that a file system is registered with a name that conflicts with an existing device or file system.
	$alt_fs_reg()$ is not thread-safe if other threads are using the device list at the time that $alt_fs_reg()$ is called. Call $alt_fs_reg()$ only in the following circumstances:
	<ul> <li>When running in single-threaded mode.</li> </ul>
	<ul> <li>From a device initialization function called by alt_sys_init().alt_sys_init() may only be called by the single-threaded C startup code.</li> </ul>
Return:	The return value is zero upon success. A negative return value indicates failure.
See also:	alt_dev_reg()

## alt\_get\_flash\_info()

Prototype:	<pre>int alt_get_flash_info(alt_flash_fd* fd,</pre>		
		<pre>flash_region* int*</pre>	
Commonly called by:	C/C++ programs	IIIC"	number_of_regions)
commonly called by.			
	Device drivers		
Thread-safe:	No.		
Available from ISR:	No.		
Include:	<sys alt_flash.h=""></sys>		
Description:	The flash part is specified by the d	lescriptor fd, a point	etails of the erase region of a flash part. ter to the start of the flash_region number of flash regions are returned in
	Call this function only when opera	ting in single-threade	ed mode.
	The only valid values for the fd pa alt_flash_open_dev function undefined.		turned from the is passed, the behavior of this function is
Return:	The return value is zero upon succ	cess. A negative retur	n value indicates failure.

## alt\_ic\_irq\_disable()

Prototype:	int alt_ic_irq_disable (alt_u32 ic_id, alt_u32 irq)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_irq.h=""></sys>
Description:	The alt_ic_irq_disable() function disables a single interrupt.
	The function arguments are as follows:
	<ul> <li>ic_id is the interrupt controller identifier (ID) as defined in system.h, identifying the external interrupt controller in the daisy chain. This argument is ignored if the external interrupt controller interface is not implemented.</li> </ul>
	<ul> <li>irq is the interrupt request (IRQ) number, as defined in system.h, identifying the interrupt to enable.</li> </ul>
	I a driver for an external interrupt controller (EIC) must implement this function.
Return:	This function returns zero if successful, or nonzero otherwise. The function fails if the $irg$ parameter is greater than the maximum interrupt port number supported by the external interrupt controller.
See also:	alt_irq_disable_all()
	alt_irq_enable()
	alt_irq_enable_all()
	alt_irq_enabled()

	alt_ic_irq_enabled()
	alt_ic_isr_register()

## alt\_ic\_irq\_enabled()

Prototype: Commonly called by: Thread-safe: Available from ISR: Include: Description:	<pre>int alt_ic_irq_enabled (alt_u32 ic_id, alt_u32 irq) Device drivers Yes. Yes. <sys alt_irq.h=""> This function determines whether a specified interrupt is enabled.</sys></pre>
	The function arguments are as follows:
	<ul> <li>ic_id is the interrupt controller ID as defined in system.h, identifying the external interrupt controller in the daisy chain. This argument is ignored if the external interrupt controller interface is not implemented.</li> </ul>
	irq is the IRQ number, as defined in system.h, identifying the interrupt to enable.
	I read a context of the second s
Return:	Returns zero if the specified interrupt is disabled, and nonzero otherwise.
See also:	alt_irq_disable()
	alt_irq_disable_all()
	alt_irg_enable()
	alt_irg_enable_all()
	alt_irg_register()
	alt_irg_enabled()
	alt_ic_irq_disable()
	alt_ic_irq_enable()
	alt_ic_isr_register()

## alt\_ic\_isr\_register()

Prototype:	<pre>int alt_ic_isr_register (alt_u32 ic_id,</pre>
Commonly called by:	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_irq.h=""></sys>
Description:	The alt_ic_isr_register() function registers an ISR. If the function is successful, the requested interrupt is enabled on return, and isr and isr_context are inserted in the vector table.
	The function arguments are as follows:
	<ul> <li>ic_id is the interrupt controller ID as defined in system.h, identifying the external interrupt controller in the daisy chain. This argument is ignored if the external interrupt controller interface is not implemented.</li> </ul>
	<ul> <li>irq is the IRQ number, as defined in system.h, identifying the interrupt to register.</li> </ul>
	<ul> <li>isr is the function that is called when the interrupt is accepted.</li> </ul>
	<ul> <li>isr_context is the input argument to isr. isr_context points to a data structure associated with the device driver instance.</li> </ul>
	flags is reserved.
	The ISR function prototype is defined as follows:
	<pre>typedef void (*alt_isr_func) (void* isr_context);</pre>
	Calls to <code>alt_ic_isr_register()</code> replace previously registered handlers for interrupt irq.
	If isr is set to null, the interrupt is disabled.
	I A driver for an EIC must implement this function.
Return:	This function returns zero if successful, or nonzero otherwise. The function fails if the irg parameter is greater than the maximum interrupt port number supported by the external interrupt controller.
See also:	alt_irq_disable()
	alt_irq_disable_all()
	alt_irq_enable()

## alt\_icache\_flush()

Prototype:	void alt_icache_flush (void* start, alt_u32 len)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_cache.h=""></sys>
Description:	The alt_icache_flush() function invalidates the instruction cache for a memory region of length len bytes, starting at address start.
	In processors without instruction caches, it has no effect.
Return:	-
See also:	alt_dcache_flush()
	alt_dcache_flush_all()
	alt_icache_flush_all()
	alt_remap_cached()
	alt_remap_uncached()
	alt_uncached_free()

alt\_ic\_isr\_register()

## alt\_irq\_disable\_all()

Prototype:	alt_irq_context alt_irq_disable_all (void)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_irq.h=""></sys>
Description:	The alt_irq_disable_all() function disables all maskable interrupts. Nonmaskable interrupts (NMIs) are unaffected.
Return:	Pass the return value as the input argument to a subsequent call to alt_irg_enable_all().
See also:	alt_irq_disable()
	alt_irq_enable()
	alt_irq_enable_all()
	alt_irq_enabled()
	alt_irq_register()
	alt_ic_irq_disable()
	alt_ic_irq_enable()
	alt_ic_irq_enabled()
	alt_ic_isr_register()

#### alt\_irq\_enable()

Prototype:	int alt_irq_enable (alt_u32 id)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_irq.h=""></sys>
Description:	The alt_irq_enable() function enables a single interrupt.
Return:	The return value is zero.
See also:	alt_irq_disable()
	alt_irq_disable_all()
	alt_irq_enable_all()
	alt_irq_enabled()
	alt_irq_register()
	alt_ic_irq_disable()
	alt_ic_irq_enable()
	alt_ic_irq_enabled()
	alt_ic_isr_register()

## alt\_irq\_enable\_all()

Prototype:	<pre>void alt_irq_enable_all (alt_irq_context context)</pre>
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_irq.h=""></sys>
Description:	The alt_irq_enable_all() function enables all interrupts that were previously disabled by alt_irq_disable_all(). The input argument, context, is the value returned by a previous call to alt_irq_disable_all(). Using context allows nested calls to alt_irq_disable_all() and alt_irq_enable_all(). As a result, alt_irq_enable_all() does not necessarily enable all interrupts, such as interrupts explicitly disabled by alt_irq_disable().
Return:	-
See also:	alt_irq_disable()
	alt_irq_disable_all()
	alt_irq_enable()
	alt_irg_enabled()
	alt_irq_register()
	alt_ic_irq_disable()
	alt_ic_irq_enable()
	alt_ic_irq_enabled()
	alt_ic_isr_register()

#### alt\_irq\_enabled()

Prototype:	int alt_irq_enabled (void)
Commonly called by:	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_irq.h=""></sys>
Description:	Determines whether maskable exceptions (status.PIE) are enabled.
	I First function is part of the legacy HAL interrupt API, which is deprecated. Altera recommends using the enhanced HAL interrupt API.
	For details about using the enhanced HAL interrupt API, refer to "Interrupt Service Routines" in the <i>Exception Handling</i> chapter of the <i>Nios II Software Developer's Handbook</i> .
Return:	Returns zero if interrupts are disabled, and non-zero otherwise.
See also:	alt_irq_disable()
	alt_irq_disable_all()
	alt_irq_enable()
	alt_irq_enable_all()
	alt_irg_register()
	alt_ic_irq_disable()

	<pre>alt_ic_irq_enabled()</pre>			
	<pre>alt_ic_isr_register()</pre>			

#### alt\_llist\_insert()

Prototype:	<pre>void alt_llist_insert(alt_llist* list,</pre>
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	No.
Available from ISR:	Yes.
Include:	<sys alt_llist.h=""></sys>
Description:	The alt_llist_insert() function inserts the doubly linked list entry entry in the list list. This operation is not reentrant. For example, if a list can be manipulated from different threads, or from within both application code and an ISR, some mechanism is required to protect access to the list. Interrupts can be locked, or in MicroC/OS-II, a mutex can be used.
Return:	-
See also:	<pre>alt_llist_remove()</pre>

## alt\_llist\_remove()

Prototype:	<pre>void alt_llist_remove(alt_llist* entry)</pre>
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	No.
Available from ISR:	Yes.
Include:	<sys alt_llist.h=""></sys>
Description:	The alt_llist_remove() function removes the doubly linked list entry entry from the list it is currently a member of. This operation is not reentrant. For example if a list can be manipulated from different threads, or from within both application code and an ISR, some mechanism is required to protect access to the list. Interrupts can be locked, or in MicroC/OS-II, a mutex can be used.
Return:	-
See also:	alt_llist_insert()

#### alt\_load\_section()

Prototype:	<pre>void alt_load_section(alt_u32* from,</pre>	
Commonly called by:	C/C++ programs	
Thread-safe:	No.	
Available from ISR:	No.	
Include:	<sys alt_load.h=""></sys>	
Description:	When operating in run-from-flash mode, the sections .exceptions, .rodata, and .rwdata are automatically loaded from the boot device to RAM at boot time. However, if there are any additional sections that require loading, the alt_load_section() function loads them manually before these sections are used.	
	The input argument from is the start address in the boot device of the section; to is the start address in RAM of the section, and end is the end address in RAM of the section.	
	To load one of the additional memory sections provided by the default linker script, use the macro ALT_LOAD_SECTION_BY_NAME rather than calling alt_load_section() directly. For example, to load the section .onchip_ram, use the following code:	
	ALT_LOAD_SECTION_BY_NAME(onchip_ram);	
	The leading '.' is omitted in the section name. This macro is defined in the header <b>sys/alt_load.h</b> .	
Return:	-	
See also:	-	

## alt\_nticks()

Prototype:	alt_u32 alt_nticks (void)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_alarm.h=""></sys>
Description:	The alt_nticks() function.
Return:	Returns the number of elapsed system clock tick since reset. It returns zero if there is no system clock available.
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_sysclk_init()
	alt_tick()
	alt_ticks_per_second()
	gettimeofday()
	settimeofday()
	times()
	usleep()

#### alt\_read\_flash()

Prototype:	int alt_read_flash	(alt_flash_fd* int void* int	fd, offset, dest_addr, length)
Commonly called by:	C/C++ programs		
	Device drivers		
Thread-safe:	No.		
Available from ISR:	No.		
Include:	<sys alt_flash.h=""></sys>		
Description:	The alt_read_flash() function reads data from flash. length bytes are re flash fd, starting offset bytes from the beginning of the flash and are written to dest_addr.		
	Call this function only when	operating in single-th	nreaded mode.
	The only valid values for the alt_flash_open_dev undefined.	•	ose returned from the value is passed, the behavior of this function is
Return:	The return value is zero on s	success and nonzero	otherwise.

	alt_flash_close_dev	v()	
	alt_flash_open_dev	()	
	alt_get_flash_info	()	
	<pre>alt_write_flash()</pre>		
	alt_write_flash_blo	ock()	

#### alt\_remap\_cached()

Prototype:	void* alt_remap_cached	(volatile void* alt_u32	ptr, len);
Commonly called by:	C/C++ programs		
	Device drivers		
Thread-safe:	Yes.		
Available from ISR:	No.		
Include:	<sys alt_cache.h=""></sys>		
Description:	The alt_remap_cached() fun memory to map is len bytes, starti		of memory for cached access. The
	Processors that do not have a data of	cache return uncached	memory.
Return:	The return value for this function is	the remapped memory	region.
See also:	alt_dcache_flush()		
	alt_dcache_flush_all()		
	alt_icache_flush()		
	alt_icache_flush_all()		
	alt_remap_uncached()		
	alt_uncached_free()		
	alt_uncached_malloc()		

#### alt\_remap\_uncached()

Prototype:	volatile void* alt_remap_uncached (void* ptr, alt_u32 len);
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_cache.h=""></sys>
Description:	The alt_remap_uncached() function remaps a region of memory for uncached access. The memory to map is len bytes, starting at address ptr.
	Processors that do not have a data cache return uncached memory.
Return:	The return value for this function is the remapped memory region.
See also:	alt_dcache_flush()
	alt_dcache_flush_all()
	alt_icache_flush()
	alt_icache_flush_all()
	alt_remap_cached()
	alt_uncached_free()
	alt_uncached_malloc()

## alt\_sysclk\_init()

Prototype:	int alt_sysclk_init (alt_u32 nticks)
Commonly called by:	Device drivers
Thread-safe:	No.
Available from ISR:	No.
Include:	<sys alt_alarm.h=""></sys>
Description:	The alt_sysclk_init() function registers the presence of a system clock driver. The input argument is the number of ticks per second at which the system clock is run.
	The expectation is that this function is only called from within <code>alt_sys_init()</code> , that is, while the system is running in single-threaded mode. Concurrent calls to this function might lead to unpredictable results.
Return:	This function returns zero on success; otherwise it returns a negative value. The call can fail if a system clock driver is already registered, or if no system clock device is available.
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_nticks()
	alt_tick()
	alt_ticks_per_second()
	gettimeofday()
	settimeofday()
	times()
	usleep()

#### alt\_tick()

Prototype:	void alt_tick (void)
Commonly called by:	Device drivers
Thread-safe:	No.
Available from ISR:	Yes.
Include:	<sys alt_alarm.h=""></sys>
Description:	Only the system clock driver may call the alt_tick() function. The driver is responsible for making periodic calls to this function at the rate specified in the call to alt_sysclk_init(). This function provides notification to the system that a system clock tick has occurred. This function runs as a part of the ISR for the system clock driver.
Return:	-
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_nticks()
	alt_sysclk_init()
	alt_ticks_per_second()
	gettimeofday()
	settimeofday()
	times()
	usleep()

## alt\_ticks\_per\_second()

Prototype:	alt_u32 alt_ticks_per_second (void)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys alt_alarm.h=""></sys>
Description:	The alt_ticks_per_second() function returns the number of system clock ticks that elapse per second. If there is no system clock available, the return value is zero.
Return:	Returns the number of system clock ticks that elapse per second.
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_nticks()
	alt_sysclk_init()
	alt_tick()
	gettimeofday()
	settimeofday()
	times()
	usleep()

#### alt\_timestamp()

Prototype:	alt_u32 alt_timestamp (void)	
Commonly called by:	C/C++ programs	
Thread-safe:	See description.	
Available from ISR:	See description.	
Include:	<sys alt_timestamp.h=""></sys>	
Description:	The alt_timestamp() function returns the current value of the timestamp counter. Refer to "Using Timer Devices" in the <i>Developing Programs Using the Hardware Abstraction Layer</i> chapter of the <i>Nios II Software Developer's Handbook</i> . The implementation of this function is provided by the timestamp driver. Therefore, whether this function is thread-safe and or available at interrupt level depends on the underlying driver.	
	Always call the <code>alt_timestamp_start()</code> function before any calls to <code>alt_timestamp()</code> . Otherwise the behavior of <code>alt_timestamp()</code> is undefined.	
Return:	Returns the current value of the timestamp counter.	
See also:	alt_timestamp_freq()	
	alt_timestamp_start()	

## alt\_timestamp\_freq()

Prototype:	alt_u32 alt_timestamp_freq (void)
Commonly called by:	C/C++ programs
Thread-safe:	See description.
Available from ISR:	See description.
Include:	<sys alt_timestamp.h=""></sys>
Description:	The alt_timestamp_freq() function returns the rate at which the timestamp counter increments. Refer to "Using Timer Devices" in the <i>Developing Programs Using the Hardware Abstraction Layer</i> chapter of the <i>Nios II Software Developer's Handbook</i> . The implementation of this function is provided by the timestamp driver. Therefore, whether this function is thread-safe and or available at interrupt level depends on the underlying driver.
Return:	The returned value is the number of counter ticks per second.
See also:	alt_timestamp()
	alt_timestamp_start()

#### alt\_timestamp\_start()

Prototype:	int alt_timestamp_start (void)
Commonly called by:	C/C++ programs
Thread-safe:	See description.
Available from ISR:	See description.
Include:	<sys alt_timestamp.h=""></sys>
Description:	The alt_timestamp_start() function starts the system timestamp counter. Refer to "Using Timer Devices" in the <i>Developing Programs Using the Hardware Abstraction Layer</i> chapter of the <i>Nios II Software Developer's Handbook</i> . The implementation of this function is provided by the timestamp driver. Therefore, whether this function is thread-safe and or available at interrupt level depends on the underlying driver.
	This function resets the counter to zero, and starts the counter running.
Return:	The return value is zero on success and nonzero otherwise.
See also:	alt_timestamp()
	alt_timestamp_freq()

## alt\_uncached\_free()

Prototype:	void alt uncached free (volatile void* ptr)
•••	
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_cache.h=""></sys>
Description:	The alt_uncached_free() function causes the memory pointed to by ptr to be deallocated, that is, made available for future allocation through a call to alt_uncached_malloc(). The input pointer, ptr, points to a region of memory previously allocated through a call to alt_uncached_malloc(). Behavior is undefined if this is not the case.
Return:	-
See also:	alt_dcache_flush()
	alt_dcache_flush_all()
	alt_icache_flush()
	alt_icache_flush_all()
	alt_remap_cached()
	alt_remap_uncached()
	alt_uncached_malloc()

## alt\_uncached\_malloc()

Prototype:	volatile void* alt_uncached_malloc (size_t size)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<sys alt_cache.h=""></sys>
Description:	The alt_uncached_malloc() function allocates a region of uncached memory of length size bytes. Regions of memory allocated in this way can be released using the alt_uncached_free() function.
	Processors that do not have a data cache return uncached memory.
Return:	If sufficient memory cannot be allocated, this function returns null, otherwise a pointer to the allocated space is returned.
See also:	alt_dcache_flush()
	alt_dcache_flush_all()
	alt_icache_flush()
	alt_icache_flush_all()
	alt_remap_cached()
	alt_remap_uncached()
	alt_uncached_free()

## alt\_write\_flash()

Prototype:	int alt_write_flash	(alt_flash_fd* int const void* int	fd, offset, src_addr, length)
Commonly called by:	C/C++ programs		
	Device drivers		
Thread-safe:	No.		
Available from ISR:	No.		
Include:	<sys alt_flash.h=""></sys>		
Description:	The alt_write_flash() function writes data to flash. The data to be written is at address src_addr. length bytes are written to the flash fd, offset bytes from the beginning of the flash device address space.		
	any unwritten areas of any fla	ash sectors affected b	readed mode. This function does not preserve y this write. Refer to "Using Flash Devices" in <i>traction Layer</i> chapter of the <i>Nios II Software</i>
	The only valid values for the alt_flash_open_dev f undefined.	•	se returned from the ralue is passed, the behavior of this function is
Return:	The return value is zero on si	uccess and nonzero o	therwise.
See also:	alt_erase_flash_blo	ck()	
	alt_flash_close_dev	•()	
	alt_flash_open_dev(	)	
	alt_get_flash_info(	)	
	alt_read_flash()		
	alt_write_flash_blo	ck()	

#### alt\_write\_flash\_block()

Prototype:	int alt_write_flash_block	(alt_flash_fd* int int const void int	fd, block_offset, data_offset, *data, length)
Commonly called by:	C/C++ programs		
	Device drivers		
Thread-safe:	No.		
Available from ISR:	No.		
Include:	<sys alt_flash.h=""></sys>		
Description:	The alt_write_flash_block() function writes one block of data of flash. The data written is at address data. length bytes are written to the flash fd, into the block star offset block_offset from the beginning of the flash address space. The data starts a data_offset from the beginning of the flash address space.		e flash £d, into the block starting at dress space. The data starts at offset bace. er to "Using Flash Devices" in the
	Developing Programs Using the Hardy Developer's Handbook.	ware Abstraction Laye	r chapter of the <i>Nios II Software</i>
	Call this function only when operating	in single-threaded me	ode.
	The only valid values for the fd paran alt_flash_open_dev function. I undefined.		
Return:	The return value is zero on success ar	nd nonzero otherwise.	
See also:	alt_erase_flash_block()		
	alt_flash_close_dev()		
	alt_flash_open_dev()		
	alt_get_flash_info()		
	alt_read_flash()		
	alt_write_flash()		

## close()

Prototype:	int close (int fd)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The close() function is the standard UNIX-style close() function, which closes the file descriptor fd.
	Calls to $close()$ are thread-safe only if the implementation of $close()$ provided by the driver that is manipulated is thread-safe.
	Valid values for the fd parameter are: <code>stdout</code> , <code>stdin</code> , and <code>stderr</code> , or any value returned from a call to <code>open()</code> .
Return:	The return value is zero on success, and $-1$ otherwise. If an error occurs, <code>errno</code> is set to indicate the cause.
See also:	fcntl()
	fstat()
	ioctl()
	isatty()
	lseek()
	open()
	read()
	stat()
	write()
	Newlib documentation

#### execve()

Prototype:	<pre>int execve(const char *path,</pre>
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<unistd.h></unistd.h>
Description:	The $execve()$ function is only provided for compatibility with newlib.
Return:	Calls to $execve()$ always fail with the return code -1 and $errno$ set to ENOSYS.
See also:	Newlib documentation

## fcntl()

Prototype:	int fcntl(int fd, int cmd)
Commonly called by:	C/C++ programs
Thread-safe:	No.
Available from ISR:	No.
Include:	<unistd.h> <fcntl.h></fcntl.h></unistd.h>
Description:	The $fcntl()$ function is a limited implementation of the standard $fcntl()$ system call, which can change the state of the flags associated with an open file descriptor. Normally these flags are set during the call to $open()$ . The main use of this function is to change the state of a device from blocking to nonblocking (for device drivers that support this feature).
	The input argument fd is the file descriptor to be manipulated. $cmd$ is the command to execute, which can be either F_GETFL (return the current value of the flags) or F_SETFL (set the value of the flags).
Return:	If cmd is F_SETFL, the argument arg is the new value of flags, otherwise arg is ignored. Only the flags O_APPEND and O_NONBLOCK can be updated by a call to fcntl(). All other flags remain unchanged. The return value is zero on success, or $-1$ otherwise.
	If cmd is F_GETFL, the return value is the current value of the flags. If an error occurs, $-1$ is returned.
	In the event of an error, errno is set to indicate the cause.
See also:	close()
	fstat()
	ioctl()
	isatty()
	lseek()
	read()
	stat()
	write()
	Newlib documentation

## fork()

Prototype:	pid_t fork (void)
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	no
Include:	<unistd.h></unistd.h>
Description:	The $fork()$ function is only provided for compatibility with newlib.
Return:	Calls to ${\tt fork}($ ) always fails with the return code –1 and ${\tt errno}$ set to ${\tt ENOSYS}.$
See also:	Newlib documentation

## fstat()

Prototype:	int fstat (int fd, struct stat *st)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	No.
Include:	<sys stat.h=""></sys>
Description:	The fstat() function obtains information about the capabilities of an open file descriptor. The underlying device driver fills in the input st structure with a description of its functionality. Refer to the header file <b>sys/stat.h</b> provided with the compiler for the available options.
	By default, file descriptors are marked as character devices, unless the underlying driver provides its own implementation of the $fstat()$ function.
	Calls to $fstat()$ are thread-safe only if the implementation of $fstat()$ provided by the driver that is manipulated is thread-safe.
	Valid values for the fd parameter are: <code>stdout</code> , <code>stdin</code> , and <code>stderr</code> , or any value returned from a call to <code>open()</code> .
Return:	The return value is zero on success, or $-1$ otherwise. If the call fails, errno is set to indicate the cause of the error.
See also:	close()
	fcntl()
	ioctl()
	isatty()
	lseek()
	open()
	read()
	stat()
	write()
	Newlib documentation

## getpid()

Prototype:	pid_t getpid (void)
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The $getpid()$ function is provided for newlib compatibility and obtains the current process id.
Return:	Because HAL systems cannot contain multiple processes, ${\tt getpid}()$ always returns the same id number.
See also:	Newlib documentation

## gettimeofday()

Prototype:	int gettimeofday(struct timeval *ptimeval, struct timezone *ptimezone)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	Yes.
Include:	<sys time.h=""></sys>
Description:	The gettimeofday() function obtains a time structure that indicates the current time. This time is calculated using the elapsed number of system clock ticks, and the current time value set by the most recent call to settimeofday().
	If this function is called concurrently with a call to $\mathtt{settimeofday}()$ , the value returned by $\mathtt{gettimeofday}()$ is unreliable; however, concurrent calls to $\mathtt{gettimeofday}()$ are legal.
Return:	The return value is zero on success. If no system clock is available, the return value is -ENOTSUP.
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_nticks()
	alt_sysclk_init()
	alt_tick()
	alt_ticks_per_second()
	settimeofday()
	times()
	usleep()
	Newlib documentation

# ioctl()

Prototype:	int ioctl (int fd, int req, void* arg)
Commonly called by:	C/C++ programs
Thread-safe:	See description.
Available from ISR:	No.
Include:	<sys ioctl.h=""></sys>
Description:	The $ioctl()$ function allows application code to manipulate the I/O capabilities of a device driver in driver-specific ways. This function is equivalent to the standard UNIX $ioctl()$ function. The input argument fd is an open file descriptor for the device to manipulate, $req$ is an enumeration defining the operation request, and the interpretation of $arg$ is request specific.
	For file subsystems, $ioctl()$ is wrapper function that passes control directly to the appropriate device driver's $ioctl()$ function (as registered in the driver's $alt_dev$ structure).
	For devices, ioctl() handles TIOCEXCL and TIOCNXCL requests internally, without calling the device driver. These requests lock and release a device for exclusive access. For requests other than TIOCEXCL and TIOCNXCL, ioctl() passes control to the device driver's ioctl() function.
	Calls to $ioctl()$ are thread-safe only if the implementation of $ioctl()$ provided by the driver that is manipulated is thread-safe.
	Valid values for the fd parameter are: $\texttt{stdout}$ , $\texttt{stdin}$ , and $\texttt{stderr}$ , or any value returned from a call to $\texttt{open}()$ .
Return:	The interpretation of the return value is request specific. If the call fails, errno is set to indicate the cause of the error.
See also:	close()
	fcntl()
	fstat()
	isatty()
	lseek()
	open()
	read()
	stat()
	write()
	Newlib documentation

## isatty()

Prototype:	int isatty(int fd)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The $\texttt{isatty}()$ function determines whether the device associated with the open file descriptor fd is a terminal device. This implementation uses the driver's $\texttt{fstat}()$ function to determine its reply.
	Calls to $\mathtt{isatty}()$ are thread-safe only if the implementation of $\mathtt{fstat}()$ provided by the driver that is manipulated is thread-safe.
Return:	The return value is 1 if the device is a character device, and zero otherwise. If an error occurs, errno is set to indicate the cause.
See also:	close()
	fcntl()
	fstat()
	ioctl()
	lseek()
	open()
	read()
	stat()
	write()
	Newlib documentation

## kill()

Prototype:	int kill(int pid, int sig)
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<signal.h></signal.h>
Description:	The kill() function is used by newlib to send signals to processes. The input argument pid is the id of the process to signal, and sig is the signal to send. As there is only a single process in the HAL, the only valid values for pid are either the current process id, as returned by getpid(), or the broadcast values, that is, pid must be less than or equal to zero. The following signals result in an immediate shutdown of the system, without call to exit(): SIGABRT, SIGALRM, SIGFPE, SIGILL, SIGKILL, SIGPIPE, SIGQUIT, SIGSEGV, SIGTERM, SIGUSR1, SIGUSR2, SIGBUS, SIGPOLL, SIGPROF, SIGSYS, SIGTRAP,
	SIGVTALRM, SIGXCPU, and SIGXFSZ.
	The following signals are ignored: SIGCHLD and SIGURG.
	All the remaining signals are treated as errors.
Return:	The return value is zero on success, or $-1$ otherwise. If the call fails, errno is set to indicate the cause of the error.
See also:	Newlib documentation

## link()

Prototype:	int link(const char *_path1, const char *_path2)
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<unistd.h></unistd.h>
Description:	The $link()$ function is only provided for compatibility with newlib.
Return:	Calls to link( ) always fails with the return code $-1$ and ${\tt errno}$ set to ${\tt ENOSYS}.$
See also:	Newlib documentation

## lseek()

Prototype:	off_t lseek(int fd, off_t ptr, int whence)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The $lseek()$ function moves the read/write pointer associated with the file descriptor fd. lseek() is wrapper function that passes control directly to the $lseek()$ function registered for the driver associated with the file descriptor. If the driver does not provide an implementation of $lseek()$ , an error is reported.
	lseek() corresponds to the standard UNIX $lseek()$ function.
	You can use the following values for the input parameter, whence:
	SEEK_SET—The offset is set to ptr bytes.
	SEEK_CUR—The offset is incremented by ptr bytes.
	SEEK_END—The offset is set to the end of the file plus ptr bytes.
	Calls to $lseek()$ are thread-safe only if the implementation of $lseek()$ provided by the driver that is manipulated is thread-safe.
	Valid values for the fd parameter are: $tdout, tdin$ , and $tderr$ , or any value returned from a call to $open()$ .
Return:	On success, the return value is a nonnegative file pointer. The return value is $-1$ in the event of an error. If the call fails, errno is set to indicate the cause of the error.
See also:	close()
	fcntl()
	fstat()
	ioctl()
	isatty()
	open()
	read()
	stat()
	write()
	Newlib documentation

#### 14–70

## open()

Prototype:	int open (const char* pathname, int flags, mode_t mode)
Commonly called by:	C/C++ programs
Thread-safe:	See description.
Available from ISR:	No.
Include:	<unistd.h> <fcntl.h></fcntl.h></unistd.h>
Description:	The $open()$ function opens a file or device and returns a file descriptor (a small, nonnegative integer for use in read, write, etc.)
	flags is one of: O_RDONLY, O_WRONLY, or O_RDWR, which request opening the file in read-only, write-only, or read/write mode, respectively.
	You can also bitwise-OR flags with O_NONBLOCK, which causes the file to be opened in nonblocking mode. Neither $open()$ nor any subsequent operation on the returned file descriptor causes the calling process to wait.
	Not all file systems/devices recognize this option.
	mode specifies the permissions to use, if a new file is created. It is unused by current file systems, but is maintained for compatibility.
	Calls to <code>open()</code> are thread-safe only if the implementation of <code>open()</code> provided by the driver that is manipulated is thread-safe.
Return:	The return value is the new file descriptor, and $-1$ otherwise. If an error occurs, errno is set to indicate the cause.
See also:	close()
	fcntl()
	fstat()
	ioctl()
	isatty()
	lseek()
	read()
	stat()
	write()
	Newlib documentation

## read()

Prototype:	int read(int fd, void *ptr, size_t len)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The $read()$ function reads a block of data from a file or device. $read()$ is wrapper function that passes control directly to the $read()$ function registered for the device driver associated with the open file descriptor fd. The input argument, ptr, is the location to place the data read and len is the length of the data to read in bytes.
	Calls to read() are thread-safe only if the implementation of read() provided by the driver that is manipulated is thread-safe.
	Valid values for the fd parameter are: <code>stdout</code> , <code>stdin</code> , and <code>stderr</code> , or any value returned from a call to <code>open()</code> .
Return:	The return argument is the number of bytes read, which might be less than the requested length
	The return value is $-1$ upon an error. In the event of an error, errno is set to indicate the cause.
See also:	close()
	fcntl()
	fstat()
	ioctl()
	isatty()
	lseek()
	open()
	stat()
	write()
	Newlib documentation

## sbrk()

Prototype:	caddr_t sbrk(int incr)
Commonly called by:	Newlib C library
Thread-safe:	No.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The $sbrk()$ function dynamically extends the data segment for the application. The input argument incr is the size of the block to allocate. Do not call $sbrk()$ directly. If you wish to dynamically allocate memory, use the newlib $malloc()$ function.
Return:	-
See also:	Newlib documentation

## settimeofday()

Prototype:	int settimeofday (const struct timeval *t, const struct timezone *tz)
Commonly called by:	C/C++ programs
Thread-safe:	No.
Available from ISR:	Yes.
Include:	<sys time.h=""></sys>
Description:	If the settimeofday() function is called concurrently with a call to gettimeofday(), the value returned by gettimeofday() is unreliable.
Return:	The return value is zero on success. If no system clock is available, the return value is -1, and errno is set to ENOSYS.
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_nticks()
	alt_sysclk_init()
	alt_tick()
	alt_ticks_per_second()
	gettimeofday()
	times()
	usleep()

## stat()

Prototype:	<pre>int stat(const char *file_name,     struct stat *buf);</pre>
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	No.
Include:	<sys stat.h=""></sys>
Description:	The stat() function is similar to the fstat() function—It obtains status information about a file. Instead of using an open file descriptor, like fstat(), stat() takes the name of a file as an input argument.
	Calls to ${\tt stat}()$ are thread-safe only if the implementation of ${\tt stat}()$ provided by the driver that is manipulated is thread-safe.
	Internally, the $\mathtt{stat}()$ function is implemented as a call to $\mathtt{fstat}().$ Refer to "fstat()" on page 14–62.
Return:	-
See also:	close()
	fcntl()
	fstat()
	ioctl()
	isatty()
	lseek()
	open()
	read()
	write()
	Newlib documentation

## times()

Prototype:	clock_t times (struct tms *buf)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys times.h=""></sys>
Description:	This times() function is provided for compatibility with newlib. It returns the number of clock ticks since reset. It also fills in the structure pointed to by the input parameter buf with time accounting information. The definition of the tms structure is:
	typedef struct {
	clock_t tms_utime;
	clock_t tms_stime;
	clock_t tms_cutime; clock_t tms_cstime;
	<pre>};</pre>
	The structure has the following elements:
	tms_utime: the processor time charged for the execution of user instructions
	<ul> <li>tms_stime: the processor time charged for execution by the system on behalf of the process</li> </ul>
	tms_cutime: the sum of the values of tms_utime and tms_cutime for all child processes
	tms_cstime: the sum of the values of tms_stime and tms_cstime for all child processes
	In practice, all elapsed time is accounted as system time. No time is ever attributed as user time. In addition, no time is allocated to child processes, as child processes cannot be spawned by the HAL.
Return:	If there is no system clock available, the return value is zero, and ${\tt errno}$ is set to ${\tt ENOSYS}.$
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_nticks()
	alt_sysclk_init()
	alt_tick()
	alt_ticks_per_second()
	gettimeofday()
	settimeofday()
	usleep()
	Newlib documentation

## unlink()

Prototype:	int unlink(char *name)
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<unistd.h></unistd.h>
Description:	The unlink() function is only provided for compatibility with newlib.
Return:	Calls to $unlink()$ always fails with the return code $-1$ and $errno$ set to ENOSYS.
See also:	Newlib documentation

## usleep()

Prototype:	int usleep (unsigned int us)
Commonly called by:	C/C++ programs
	Device drivers
Thread-safe:	Yes.
Available from ISR:	No.
Include:	<unistd.h></unistd.h>
Description:	The $usleep()$ function blocks until at least $us$ microseconds have elapsed.
Return:	The $usleep()$ function returns zero on success, or $-1$ otherwise. If an error occurs, errno is set to indicate the cause. The current implementation always succeeds.
See also:	alt_alarm_start()
	alt_alarm_stop()
	alt_nticks()
	alt_sysclk_init()
	alt_tick()
	alt_ticks_per_second()
	gettimeofday()
	settimeofday()
	times()

## wait()

Prototype:	int wait(int *status)
Commonly called by:	Newlib C library
Thread-safe:	Yes.
Available from ISR:	Yes.
Include:	<sys wait.h=""></sys>
Description:	Newlib uses the $wait()$ function to wait for all child processes to exit. Because the HAL does not support spawning child processes, this function returns immediately.
Return:	On return, the content of status is set to zero, which indicates there is no child processes.
	The return value is always $-1$ and errno is set to ECHILD, which indicates that there are no child processes to wait for.
See also:	Newlib documentation

## write()

Prototype:	int write(int fd, const void *ptr, size_t len)
Commonly called by:	C/C++ programs
	Newlib C library
Thread-safe:	See description.
Available from ISR:	no
Include:	<unistd.h></unistd.h>
Description:	The write() function writes a block of data to a file or device. write() is wrapper function that passes control directly to the write() function registered for the device driver associated with the file descriptor fd. The input argument ptr is the data to write and len is the length of the data in bytes.
	Calls to $write()$ are thread-safe only if the implementation of $write()$ provided by the driver that is manipulated is thread-safe.
	Valid values for the fd parameter are: stdout, stdin, and stderr, or any value returned from a call to $open()$ .
Return:	The return argument is the number of bytes written, which might be less than the requested length.
	The return value is $-1$ upon an error. In the event of an error, errno is set to indicate the cause.

#### **Standard Types**

In the interest of portability, the HAL uses a set of standard type definitions in place of the ANSI C built-in types. Table 14–2 describes these types, which are defined in the header file **alt\_types.h**.

 Table 14–2.
 Standard Types

Туре	Description
alt_8	Signed 8-bit integer.
alt_u8	Unsigned 8-bit integer.
alt_16	Signed 16-bit integer.
alt_u16	Unsigned 16-bit integer.
alt_32	Signed 32-bit integer.
alt_u32	Unsigned 32-bit integer.
alt_64	Signed 64-bit integer.
alt_u64	Unsigned 64-bit integer.

- Nios II Software Build Tools Reference chapter of the Nios II Software Developer's Handbook
- DMA Controller Core chapter in the Embedded Peripherals IP User Guide.
- Newlib ANSI C standard library documentation installed with the Nios II EDS. On the Windows Start menu, click Programs > Altera > Nios II <version> > Nios II Documentation.

#### **Document Revision History**

Table 14–3 shows the revision history for this document.

#### Table 14–3. Document Revision History

Date & Document Version	Changes Made	Summary of Changes
July 2010	<ul> <li>Clarify purpose of listed C header file for functions.</li> </ul>	—
v10.0.0	Correction: alt_irg_enabled() is not a legacy function.	
November 2009 v9.1.0	<ul> <li>Document new API functions: alt_ic_irq_disable(), alt_ic_irq_enable(), alt_ic_irq_enabled(), and alt_ic_isr_register()</li> <li>Deprecate API functions alt_irq_disable(), alt_irq_enable(), alt_irq_enable(), alt_irq_enabled(), and alt_irq_register()</li> </ul>	<ul> <li>Introduce enhanced HAL interrupt API</li> <li>Deprecate legacy HAL interrupt API</li> </ul>
March 2009	<ul> <li>Corrected minor typographical errors.</li> </ul>	_
v9.0.0		
May 2008 v8.0.0	Added alt_instruction_exception_register() and alt_exception_cause_generated_bad_addr() for instruction-related exception handlers.	<ul> <li>Advanced exceptions added to Nios II core</li> <li>Instruction-related exception handling added to HAL</li> </ul>
October 2007	Maintenance release	_
v7.2.0		
May 2007	<ul> <li>Added table of contents to "Introduction" section.</li> </ul>	_
v7.1.0	<ul> <li>Added Referenced Documents section.</li> </ul>	
March 2007 v7.0.0	Maintenance release	_
November 2006 v6.1.0	Function open() requires fcntl.h.	_
May 2006 v6.0.0	Maintenance release	_
October 2005 v5.1.0	Added API entries for "alt_irq_disable()" and "alt_irq_enable()", which were previously omitted by error.	_
May 2005	Added alt_load_section() function	_
v5.0.0	Added fcntl() function	
December 2004	Updated names of DMA generic requests.	_
v1.2		
September 2004 v1.1	<ul> <li>Added open().</li> <li>Added ERRNO information to alt_dma_txchan_open().</li> <li>Corrected ALT_DMA_TX_STREAM_ON definition.</li> <li>Corrected ALT_DMA_RX_STREAM_ON definition.</li> <li>Added information to alt_dma_rxchan_ioctl() and alt_dma_txchan_ioctl().</li> </ul>	_
May 2004 v1.0	Initial release	_
